Shock Freezers

Shock Freezers are professional equipment that controls temperature necessary for keeping products fresh for a long time.

While preserving the products the equipment makes to keep undamaged nutritional value of the products after being defrosted. The equipment consists of Double Stage Semi Hermetic Compressors.

The Shock Freezers System allows to lower the temperature very rapidly up to -18C degrees. Freezing is provided by air coolers of it by blowing over fronted surface of the wagon. This enables to freeze down quickly in a cold air flow. The room cold air shouldn't exceed -35C / -40C degrees. The system is very efficient and energy saving. Besides, it is proven to be a low-waste and environment friendly system.

Coldstorage

This system is manufactured and installed with the entire component like it is ready to use so costumers do not need to do anything to use warehouse.

This system can be disassembled so it can be moved to another place. This system let us give freedom to adjust aisle distance.

Cold Storage consists of following levels and types of preserving:

Cold Rooms: (+16 / +5)

Cold Storage Rooms: (+5 / -5)

Freezing Rooms: (-18 / -23)

Shock freezers: (-35 / -40)

Deepfreeze Rooms

Deep freeze rooms are for preserving products such as meat, poultry etc. for a long time. They are preserved under temperature not exceeding -18 / -23C degrees. In order to isolate these rooms 150mm width sandwich panels are used.

Coldrooms

Cold rooms are used to keep baked goods, chocolate etc. The Cold rooms prevent bacteria from growing. Low ventilation allows workers to work without putting in danger their health, which is very important aspect too.
